

1    **ABSTRACT OF THE DISCLOSURE**

2           A laryngeal mask airway has a dual-airway, a back plate with a smooth  
3   extended tongue and a laryngeal mask with a top surface. The back plate is  
4   integrally formed with the top surface of the laryngeal mask. The dual-airway  
5   communicates with the back plate. The dual-airway further has a secondary  
6   tube for injecting air into the bladder. Because the extended tongue of back  
7   plate is integrally formed on the laryngeal mask, laryngeal mask airways in  
8   accordance with the present invention are easy and have a guide to insert into  
9   the larynx without the tip folding over.
